EVI-Pro: Electric Vehicle Infrastructure – Projection Tool

NREL's Electric Vehicle Infrastructure – Projection (EVI-Pro) tool estimates how much electric vehicle (EV) charging infrastructure is needed in a designated area to meet a given demand.

Developed in collaboration with the California Energy Commission, EVI-Pro draws on detailed data about personal vehicle travel patterns, EV attributes, and charging station characteristics to estimate the required quantity and type of charging infrastructure.

Capabilities and Uses

A key player in NREL's world-class EV charging infrastructure analysis capabilities, EVI-Pro is a part of the [EVI-X modeling suite](#) for charging network planning, site design, and financial analyses.

Researchers use EVI-Pro to:

- Analyze the typical daily travel patterns of light-duty vehicles, estimate related charging demand, and design infrastructure capable of meeting the demand
- Account for variations and uncertainty in vehicle and charger technologies, user demographics, market adoption conditions, the shared use of chargers, and EV travel and charging preferences.

A simplified, web-based version of the tool—[EVI-Pro Lite](#)—is geared for use by U.S. cities and states to estimate their charging infrastructure needs and the associated power demands on the grid.

Case Study: National Charging Infrastructure Analysis

Ambitious federal clean energy goals, including efforts to see EVs represent the majority of light-duty vehicle sales by 2030, could lead to 30 million–42 million EVs on the road by 2030. An NREL study, detailed in the [The 2030 National Charging Network](#) report, has estimated the number, type, and location of infrastructure needed to support these vehicles. That infrastructure will form the backbone of the country's next great public works project: nationwide access to EV charging. For more information, refer to the [Building the 2030 National Charging Network](#) news article.

Publications

The following publications provide detailed information about NREL's EV infrastructure analyses. For NREL's full collection of documents, visit the [Publications Database](#).
